

WHAT IS CLAIMED IS:

1. An external output video signal processor possessing a video signal processing circuit, which has a latter part processing circuit
5 which inputs a system controller which outputs a video signal, and video signal output from this system controller, and controls and outputs the p-p value to a predetermined value, said external output video signal processor comprises:
said system controller outputs a video signal by which the sync. tip level
10 and the pedestal level were fixed to a predetermined value;
said video signal processing circuit provides with a level shift circuit which adjusts the level of said video signal input directly from said system controller; and outputs it to said latter part processing circuit.
- 15 2. An external output video signal processor according to Claim 1, which comprises two stages of an inverting amplifier.
